Short Note

Road Safety Audit: Quick Field Checklist for Highway Corridors

A concise practice-ready note for screening roadside safety issues during preliminary site visits. Suitable for academic demonstration and portfolio showcase use.

Focus	
Use case	Quick screening before detailed audit
Prepared for	Showcase page - Short Note viewer
Prepared by	Mihir Koladiya

Purpose

This short note summarises practical checkpoints that can be used during an initial highway corridor safety review. It is not a substitute for a full IRC-based road safety audit, but it helps identify obvious hazards that require immediate documentation or follow-up.

Core field checks

Review cross-section consistency, shoulder condition, median treatment, delineation, retroreflective signs, pavement markings, sight obstruction, access management, pedestrian exposure near settlements, bus stop placement, roadside hazard clearance, drainage outfalls, and speed environment mismatch.

High-risk indicators

Repeated skid marks, broken parapets, edge drop-offs, hidden junctions, abrupt lane narrowing, missing chevron signs on curves, informal pedestrian crossings, and unprotected fixed objects within the clear zone should be treated as high-priority findings.

Documentation practice

For each issue, record chainage/location, photo direction, deficiency description, probable crash risk mechanism, and a simple risk priority tag such as immediate, short-term, or long-term action. GIS-based geotagging is recommended where possible.

Rapid checklist

- Are warning and regulatory signs present, visible, and readable?
- Do curves have adequate delineation, chevrons, and sight distance?
- Are shoulders usable and free from abrupt edge drop-off?
- Are median openings channelised and controlled?
- Are settlements, schools, or bus stops exposed to fast traffic?
- Are roadside hazards shielded or set back from traffic?
- Are drainage elements protected and non-hazardous?

Priority matrix

Observation	Potential risk	Suggested priority
Missing curve warning signs	Run-off-road crash risk	Immediate
Damaged shoulder edge	Loss-of-control for two-wheelers	Immediate
Unmarked pedestrian crossing desire line	Pedestrian conflict	Short-term
Poor bus bay geometry	Rear-end and side-swipe conflict	Short-term
Encroached sight triangle at minor junction	Angle collision risk	Immediate

Closing note

This document is intentionally concise so it can act as a showcase item in the website viewer. It demonstrates how a short technical note can be presented with an embedded PDF experience.
